CEMinar

‘Do we Still Need Pangenome Graphs?’

Dr. Andrea Guarracino

Assistant Professor, Translational Genomics Research Institute (TGen)

Standard genomic analysis aligns reads to a single linear reference, which introduces bias and misrepresents complex variation. Pangenome graphs address this by jointly encoding variation across many genomes, but building and storing explicit graphs at population scale is computationally prohibitive. In this seminar I will describe an alternative: rather than constructing the full graph, we use pangenome alignment and indexed representations to answer the same queries directly. This reduces compute and memory by orders of magnitude, making population-scale analysis tractable on a single laptop.

DETAILS:

Date: Oct. 8,, 2026
Time: 12 - 1 pm
Location: ASU Tempe Campus, Life Sciences Bldg. C, room 202 (LSC-202)

Can’t join in person? Join us via Zoom:
